Thanks for sharing David. Wow, this plan has a lot of overlap with the animal surveillance side of things with EHP. I'll definitely add this to the agenda for discussion on our EHP call next week.

PREDICT team and Gwen -

Please see the draft recommendations for the REDISSE activities in Sierra Leone. The World Bank has had a series of workplans over the past couple of weeks in country to discuss and to update the attached spreadsheet which was developed in July.

Roger Morris is the World Bank's One Health advisor from Massey University in New Zealand. He has made a series of recommendations for Sierra Leone in the attachment which your country staff likely have received. This document was just sent to us today.

There are meetings in Freetown this week to finalize.

Please note that there is overlap with the Ebola Host Reservoir activities which needs to be mapped out in much more detail to avoid duplication. The REDISSE project includes taking samples from humans so a good opportunity to collaborate..

Additionally -- for FAO-- it's noted in the REDISSE workplan that Teko lab will fully be covered by FAO. if there are additionally needs for support in the future-- it's important to get this incorporated into the REDISSE workplan or there will be no additional budget.

The recommendations include constructing a new lab for human and animal health which the USG (CDC, USAID, and DoD) will push back on because these funds should continue to build capacity of existing labs and not build a new one.

Please do send your comments directly to your country team and copy or forward to us so that we can work together to ensure these funds complement and not duplicate our efforts.
